

ABSTRACT

A keyboard carrier installs to a platform by means of a supporting arm disposed at one side of the platform for supporting a keyboard and at least one object. The keyboard carrier includes a storage compartment and a supporting plate. The storage compartment includes a container and a cover. The container stores small objects. The cover corresponds to the container for opening and closing. The supporting plate is made of metal material for supporting the keyboard and the object and includes a first supporting surface and a second supporting surface. The first supporting surface supports the keyboard. The second supporting surface supports the object formed by expanding from the front edge of the first supporting surface towards the user. The first supporting surface and the second supporting surface are integral to the carrier.
